1. Installation and Getting Started

PetMatch is an addon for managing battle pets and teams.

Step by Step when installing manually

1. Close World of Warcraft.
2. Download the PetMatch zip file from CurseForge or GitHub.
3. Extract the zip file.
4. Place the PetMatch folder inside the AddOns folder from the game.
   Path is : World of Warcraft \ _retail_ \ Interface \ AddOns
5. Start the game and open the AddOns list on the character selection screen.
6. Enable PetMatch and log in.
7. Open the Pet Journal and check that PetMatch has appeared.

Step by Step when installing via CurseForge

1. Open CurseForge app.
2. Click on Browse tab.
3. Type in the search: PetMatch
4. Click on install button.
5. Start the game and open the AddOns list.
6. Enable PetMatch and log in.
7. Open the Pet Journal and check that PetMatch has appeared.

Important Notes

Do not nest multiple PetMatch folders. TOC compatibility does not automatically mean that every feature has been tested on every client variant.

2. Getting Oriented: Pet Journal and Toolbar

The addon includes a Pet Journal toolbar, team list, levelling queue panel, Team Setup mode, options panel, a settings window in the ingame Options panel, and more QoL features.

Step by Step

1. Open the Pet Journal.
2. Find the additional PetMatch controls near the pet interface.
3. Hover over icons to read their tooltips and identify their functions.
4. Open the Teams, Levelling, and Options tabs in turn to familiarize yourself with each screen.

Important Notes

Exact positions can vary with UI skins and settings. Use tooltips to identify buttons.

The blue sections are the parts added by PetMatch in the Pet Journal, these are buttons you can hover over to see their tooltip, the tooltips tell you what the button is for. There are some buttons that are not showing because they require a specific action to appear.

The green section is the actual addon that is being attached to the Pet Journal. PetMatch is not a standalone addon, so it will not work apart from the Pet Journal, this is intentional because PetMatch wants the player to have not only the look, but also the feel as if it is part of the game itself and not a separate addon.

3. Saving and Updating a Team

PetMatch provides separate Save Team and Update Team actions, along with a Save Team dialog.

Step by Step

1. Set up the desired pets in the standard pet battle slots.
2. Click the action to save the current team : **Save As**
3. Enter the requested team details and confirm.
4. Check that the team appears in the team list, if you have no folders created yet, the team will be automatically saved in the **Unsorted** folder.
5. Later, change your selection and use the **Update Team** button to update the selected saved team.

Important Notes

Before updating, verify which team is selected: saving and updating are different actions.

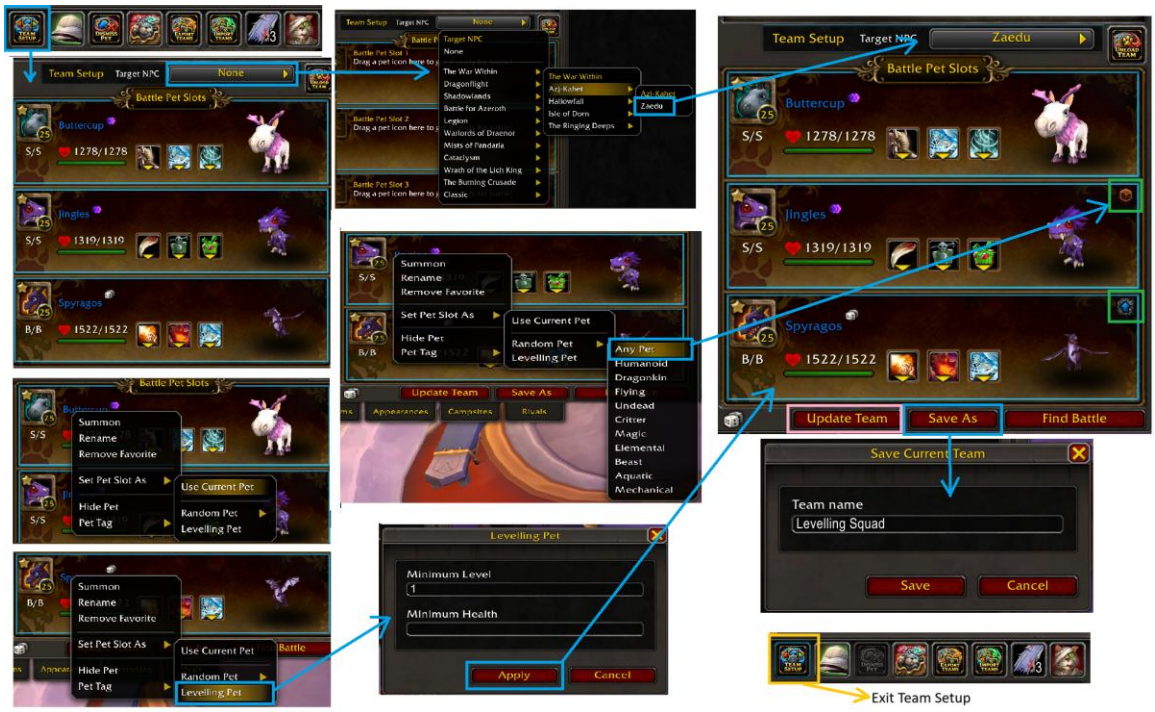

4. Team Setup

The toolbar includes a Team Setup button; which you can use to setup your own team with special pet slots, or a target NPC attached to the team.

Step by Step

1. Open the Pet Journal.
2. Activate **Team Setup** from the toolbar.
3. You will see the sections outlined that you can use for your team setup.
4. Save the team with the **Save As** button, or **Update Team** when editing an existing team.
5. Exit **Team Setup** by clicking on the button in the toolbar again when you are finished.

When entering Team Setup mode, you will notice the blue borders around the Team Setup button in the toolbar, and the pet slots, you will also see the Team Setup bar appearing where you can set the target NPC if you would like to add a target to the team.

You can set special slots; this means you can set a pet slot to be a levelling slot, or a random pet slot, this you can choose between Any Pet or a specific Pet Family. If you are editing an existing team, you can click on Update Team, or you can also save it as a new team. Click the Team Setup button again to exit the mode.

5. Folders and Team Organization

Folder and Team context menus let you help with actions that you want to do; this can either be moving the folder/team, Edit folder/team, Import teams (only on folder menu), Export folder/team, Delete folder/team, Add/Edit team notes, Add/Edit team script, open team Statistics. Most of these options will open up a dialog that let you do things or check things out.

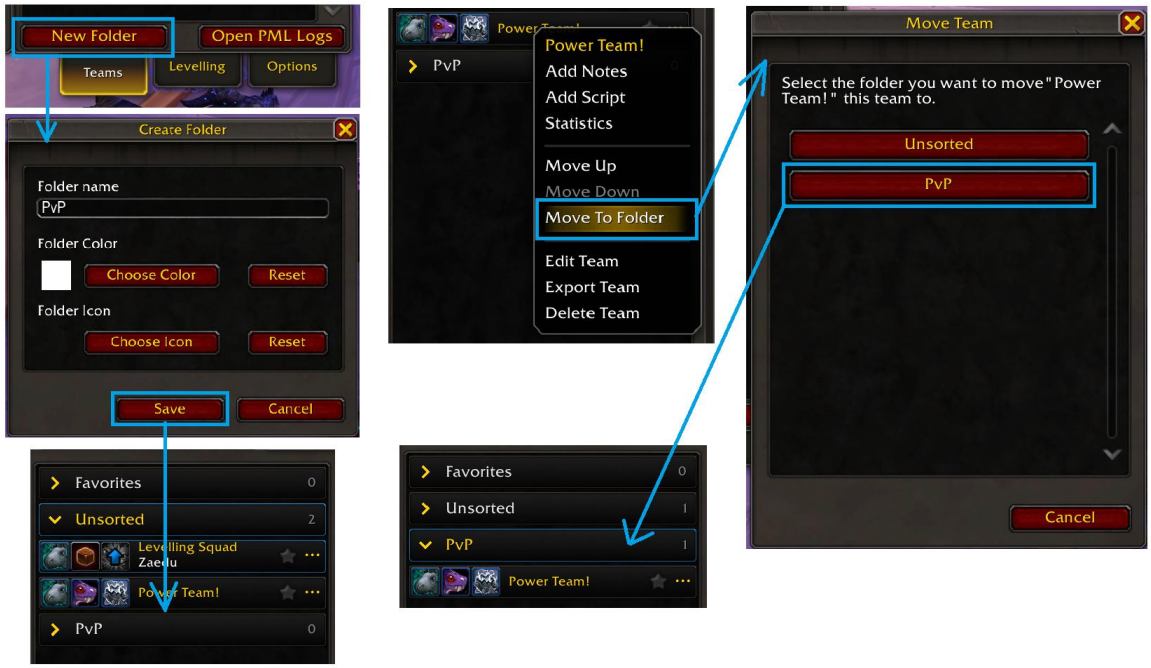

Step by Step for folder creation

1. Click on the **New Folder** button on the teams panel.
2. Fill in the folder name.
3. Add a color and/or icon if you want, these are optional.
4. Click on **Save** to save the folder.

Important Notes

When deleting a folder you can choose to either also delete the teams within the folder, or move the teams to the **Unsorted** folder. Deleting Folders and Teams will always require your confirmation, PetMatch will never just delete a team or folder without your permission.

You will also be able to drag folders and teams for moving them, you can drag teams to another folder as well, just click and hold, and move your cursor to drag the folder or team.

I do not show all dialogs here because there are just a lot to show, so I will leave it up to you to find it out yourself by opening the dialogs, just note that it is easier to use then it first looks like.

PetMatch has only set the **Favorite** button on the team card, you will also see the **three dots**, clicking on this will open up the menu, you can also right click on the team card to open the menu, for folders you can only use the right click to open the menu.

6. Loading, Unloading, and Managing Teams

The team context menu, and the unload team button support everyday team management.

Step by Step

1. Find the desired team in the list.
2. Click on the team to load the pets in the pet slots.
3. Check the three pet slots to see that the pets are loaded.
4. Open the team context menu for editing and other actions.
5. Use **Unload Team** button to unload the loaded team.
6. Only confirm deletion after checking that you selected the correct team.

Important Notes

Deleting a team is not the same as unloading it.

Export your teams before major cleanup, unless you have no need for a backup of the team/teams.

You can see the selected folder and selected team by the blue border it will have.

If you are using another UI skin, this color can be different (ElvUI also uses blue, EllesmereUI uses turquoise).

When clicking on **Unload Team** you will see this.

7. Importing Teams

Import provide a dedicated import workflow with a preview.

Step by Step

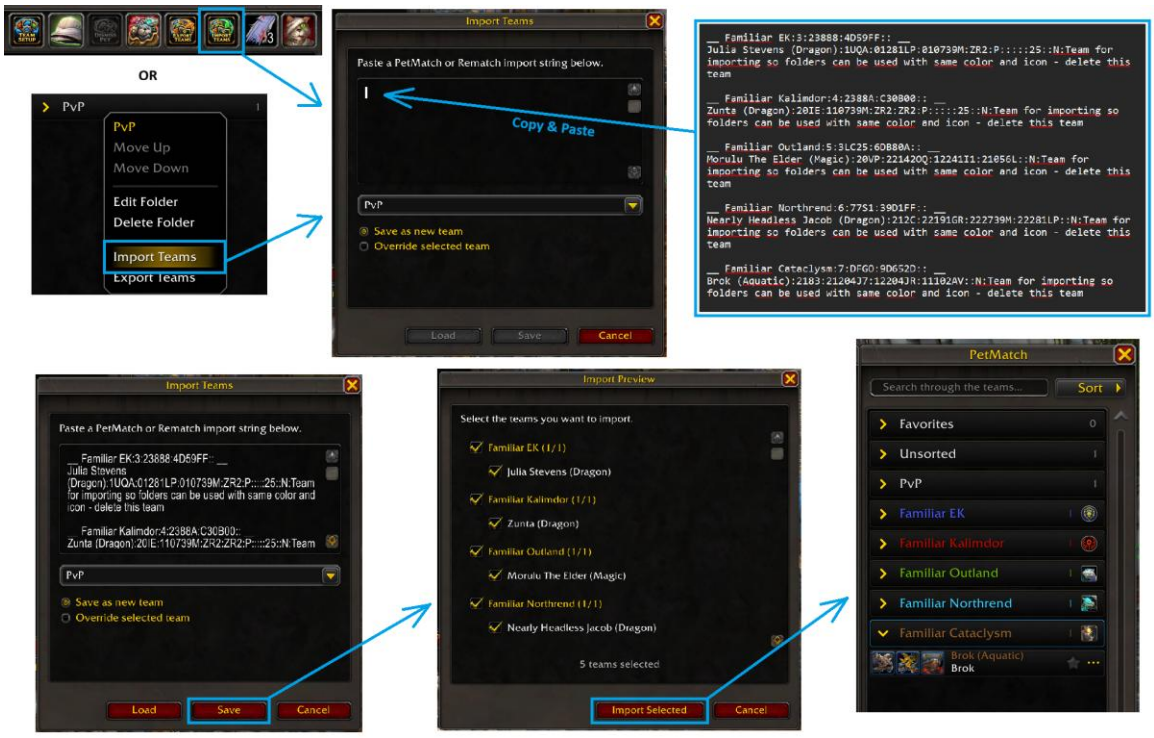

1. Open the import dialog from the PetMatch toolbar, or from the folder menu.
2. Enter the data using the input method provided.
3. Click on **Save** in order to see the preview dialog.
4. Carefully review the preview.
5. Check team names, folders, and counts. You can uncheck those you want to exclude from the import.
6. Confirm the import by clicking on **Import Selected**.
7. Check if the selected teams are in the teams panel list.

Important Notes

Use import data only in a supported format. PetMatch uses the same format as Rematch, which makes it easy to share teams, and to import teams from websites/tools where you can copy Rematch strings.

You also can directly only load a team from the import dialog if you only want to load it with an import string, be aware when only loading you will not be able to use the notes and script.

If you import only one team, you will not get the preview dialog, but be aware that you select the correct folder in the dropdown or click on the folder in the teams panel, otherwise you might be looking for the imported team.

8. Exporting Teams and Folders

The export dialog is provided for exporting team and folder data.

Step by Step

1. Open the export dialog from the PetMatch toolbar, the folder menu, or the team menu.
2. Select the export string (which is also the import string) if this is not selected, you can click on the button **Select All** to select all the text.
3. Copy the string.
4. Open notepad, word, or any other pad you use to save the string.
5. Save the string so you have it as a backup.

Important Notes

The export string only saves your folders and teams, it does not save your settings you have set in the options panel. You can easily share your strings with other players.

Depending on where you click on export, the following will happen :

- **In the toolbar** – you will export all your folders and teams, this button is good for backup.
- **In the folder menu** – you will export the folder with its teams in it.
- **In the team menu** – you will export the team only.

9. Rematch Migration and Data Preservation

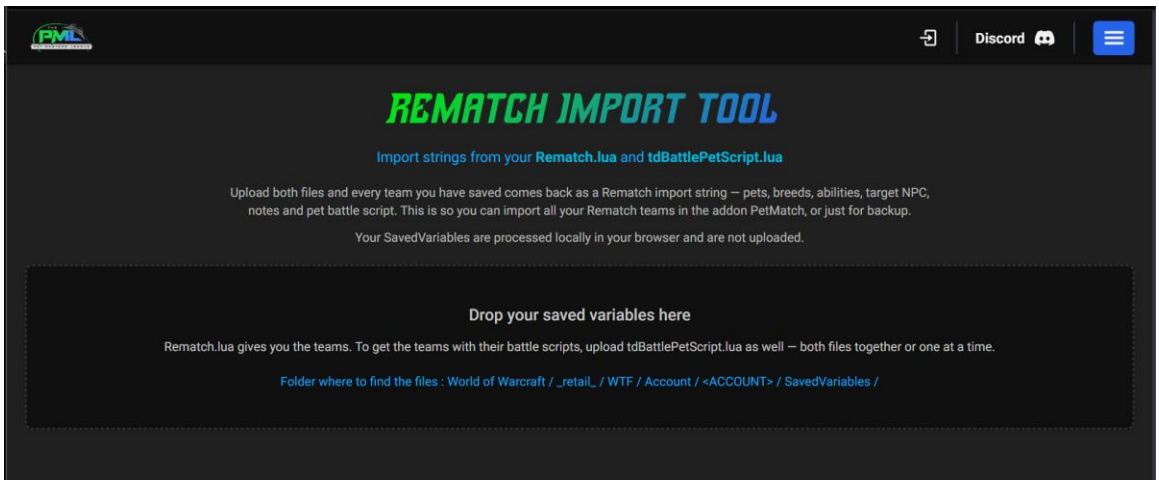

PetMatch supports Rematch team strings, including supported target NPCs, levelling preferences, notes, and scripts. Compatibility depends on the source data and format.

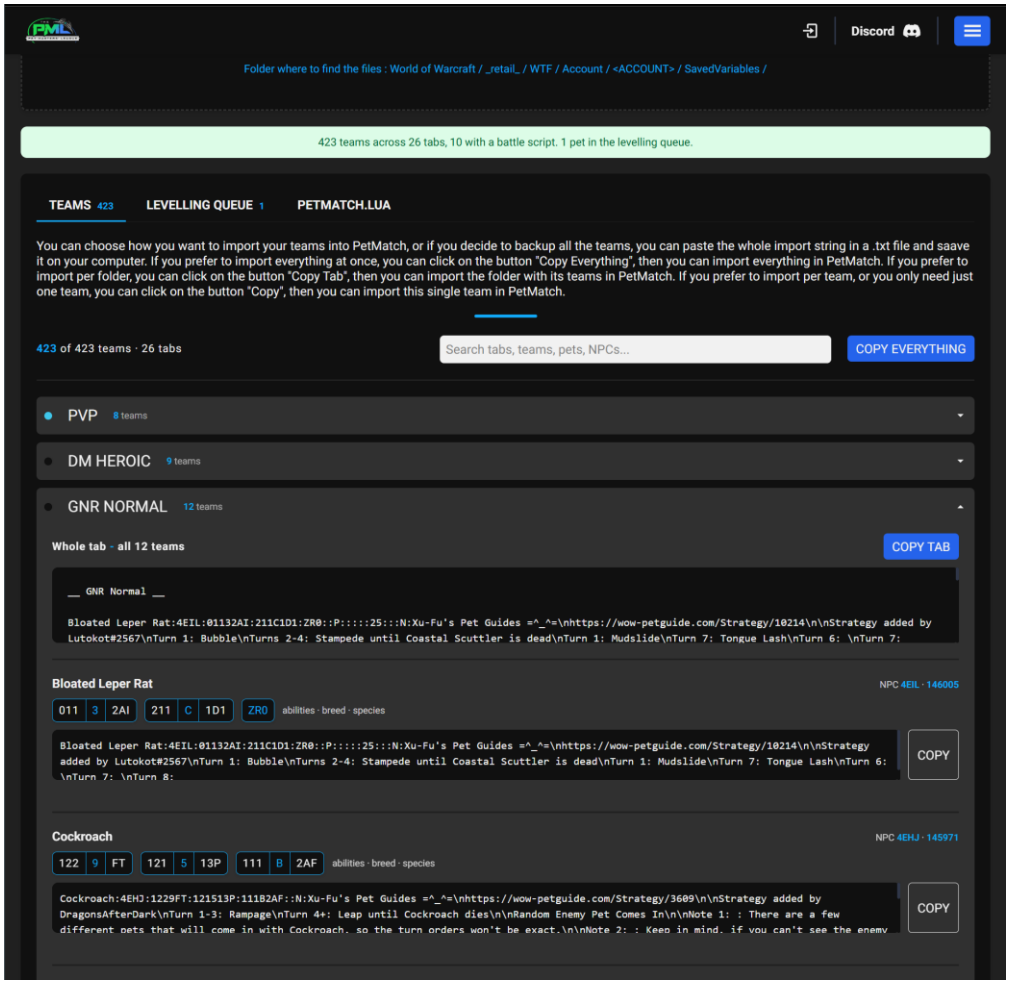

For a larger migration, the Import Tool accepts Rematch.lua and tdBattlePetScript.lua SavedVariables files. It can produce per-team, per-folder, or complete import strings, a Levelling Queue import string, and a generated PetMatch.lua SavedVariables file you can download.

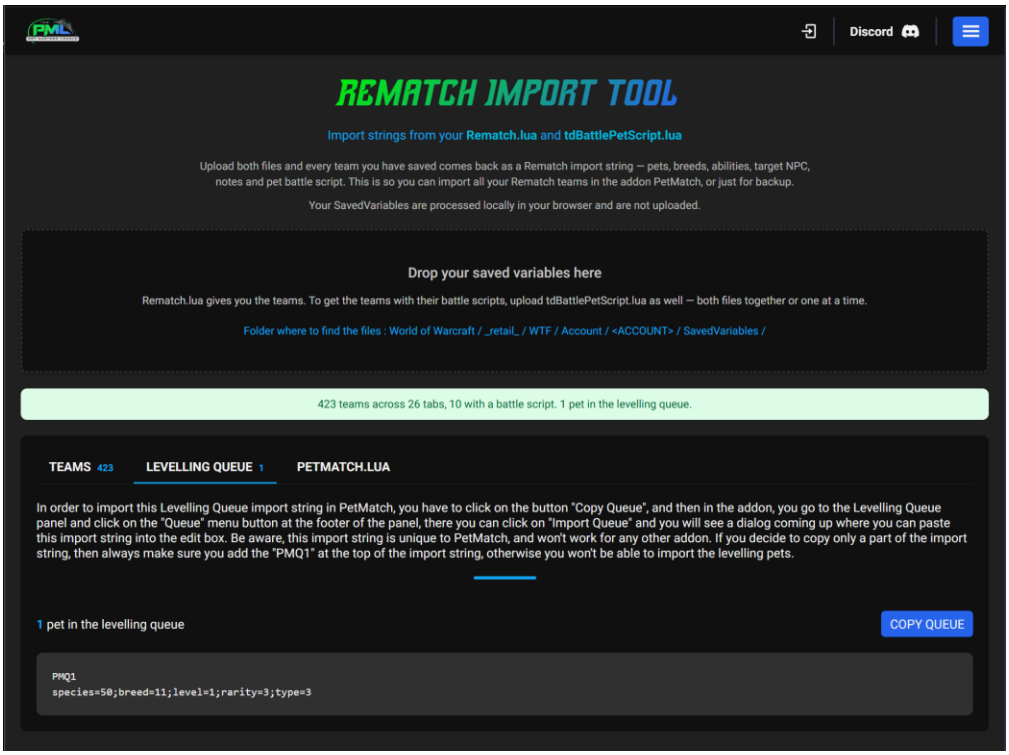

The import tool is right here : https://www.petmastersleague.com/rematch-import-tool

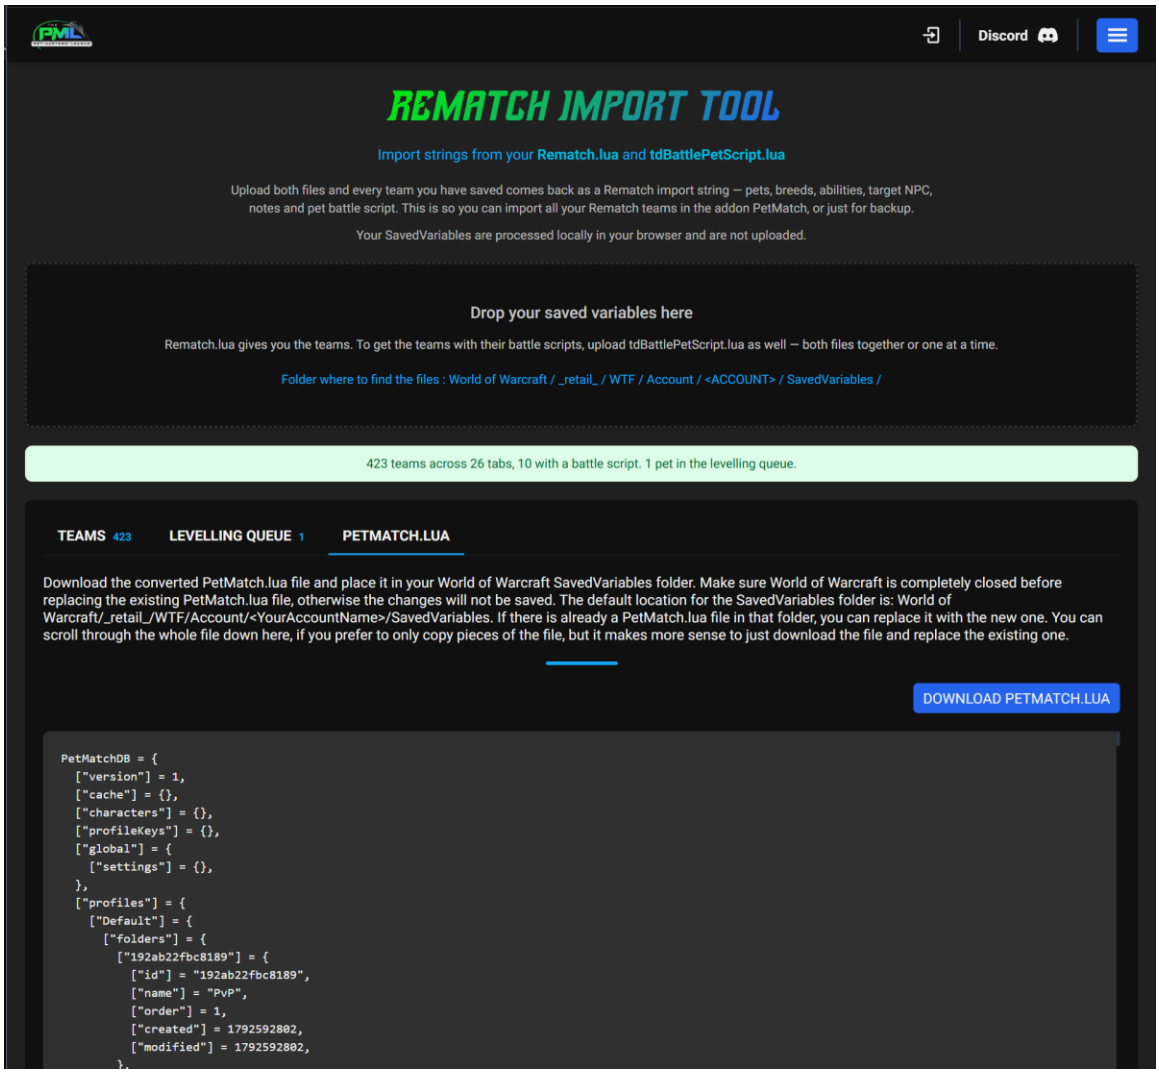

Safe migration workflow

1. Exit World of Warcraft before making SavedVariables backups.
2. Back up the original Rematch.lua, tdBattlePetScript.lua, and PetMatch.lua SavedVariables files.
3. Read the instructions on the Import Tool before replacing or importing SavedVariables.
4. Use the tool to process Rematch.lua and, if applicable, tdBattlePetScript.lua.
5. Choose the output format: individual team strings, folder collections, Levelling Queue, or a generated PetMatch.lua file;
    a. When choosing to import, you copy the import strings and paste them in the import dialog in the addon.
    b. When choosing to replace the PetMatch.lua file, download the file and move it to the SavedVariables folder, be aware that with doing this your options are set to the default options.
6. Enter the game again to check if the addon has all your teams, and no error occurs.
7. You can choose to keep the backups you made or delete them.

Discord

Discord
REMATCH IMPORT TOOL
Import strings from your Rematch.lua and tdBattlePetScript.lua
Upload both files and every team you have saved comes back as a Rematch import string — pets, breeds, abilities, target NPC, notes and pet battle script. This is so you can import all your Rematch teams in the addon PetMatch, or just for backup.
Your SavedVariables are processed locally in your browser and are not uploaded.
Drop your saved variables here
Rematch.lua gives you the teams. To get the teams with their battle scripts, upload tdBattlePetScript.lua as well — both files together or one at a time.
Folder where to find the files : World of Warcraft / _retail_ / WTF / Account / <ACCOUNT> / SavedVariables /
423 teams across 26 tabs, 10 with a battle script. 1 pet in the levelling queue.
TEAMS 423
LEVELLING QUEUE 1
PETMATCH.LUA
In order to import this Levelling Queue import string in PetMatch, you have to click on the button "Copy Queue", and then in the addon, you go to the Levelling Queue panel and click on the "Queue" menu button at the footer of the panel, there you can click on "Import Queue" and you will see a dialog coming up where you can paste this import string into the edit box. Be aware, this import string is unique to PetMatch, and won't work for any other addon. If you decide to copy only a part of the import string, then always make sure you add the "PMQ1" at the top of the import string, otherwise you won't be able to import the levelling pets.
1 pet in the levelling queue
COPY QUEUE
PMQ1
species=50;breed=11;level=1;rarity=3;type=3

Please make sure you have read the descriptions here carefully, if you still have questions, do not hesitate to ask them.

10. Target Teams and NPCs

The target team card, and targets option, indicate a separate target-team workflow.

This works as followed; when clicking on a target, PetMatch will check your teams list to see if there is a saved team for that target, if there is, then PetMatch will do the following based on the option you have set.

These options are :

- **Disabled** – PetMatch will do nothing with auto loading the team (this is the default option)
- **Show Load Team button** – this will show the Load Team button you can click on to load the saved team.
- **Load team automatically** – this will automatically load the team as soon as you click on the target NPC.
- **Ask before loading team** – this will open up a dialog to ask you for confirmation to load the saved team.

You will find this in the **Options** panel under the option **Targets**.

Load Team button

Ask to confirm

What if I have multiple teams with the same target NPC?

When this is the case, PetMatch will open a dialog with the list of the teams that have this target set to them, here you can click on the team you would like to use, and you will see that the selected team will be loaded. It does not matter which option you have chosen (except for the Disabled one), this selection dialog will always show with multiple teams available for the target.

There is also the suggested team ability on the target team card for when you have no saved team for the target, this suggested team is clickable to load the suggested team.

If you have a saved team for the target, the target team card will show your saved team instead.

11. Levelling Queue

The addon includes a Levelling Queue Panel, a Levelling Queue List, ability to drag pets up and down and to the pet slots, each pet has a context menu when right clicking on them. The panel also has a toolbar with the icon buttons for pet treats, and the generic battle pet stones. It also has a sort button with sort options to sort your levelling pets. The pets in the queue will get an indicator on them in the pets list, this way you know that this pet is in the queue waiting to be levelled.

Step by Step

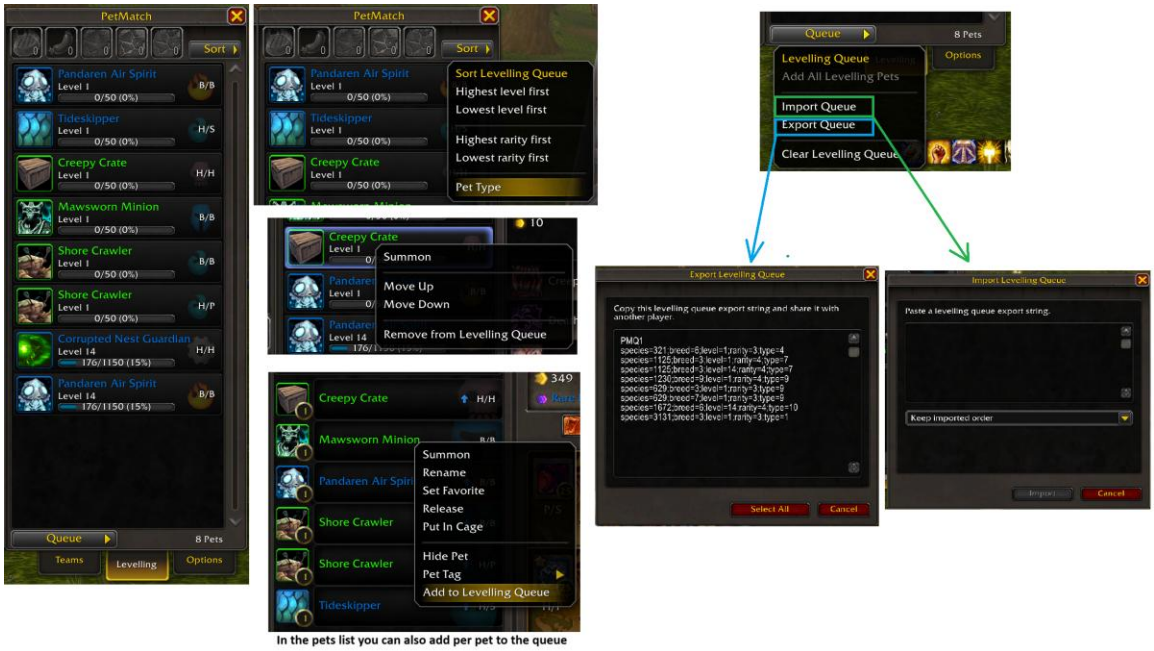

1. Open the panel by clicking on the **Levelling** tab.
2. Add/remove all pets using the available **Queue** button.
3. Import/export pets via the **Queue** button when you have an import string.
4. Check the order in the list, you can use the sort button to sort them.
5. Drag pets to rearrange them, or use the context menu to move them up or down.
6. Use the queue when levelling your pets.

Important Notes

By default the levelling teams will use levelling pets from the levelling queue from top to bottom, this is when the team has no levelling preferences set. You can change the order in the queue with the sort button, or drag/move pets if you have a specific pet you want to level first.

If a team has levelling preferences set, like a minimum level, or minimum health, the queue will act accordingly to it, so the correct levelling pet will be loaded in the team.

The **Queue** menu button at the bottom will let you import or export the levelling queue, you can also clear the queue or add all your levelling pets to the queue, note that there might be coming more options to this in future!

In the pets list you can also add per pet to the queue

12. Pet Collection and Progress

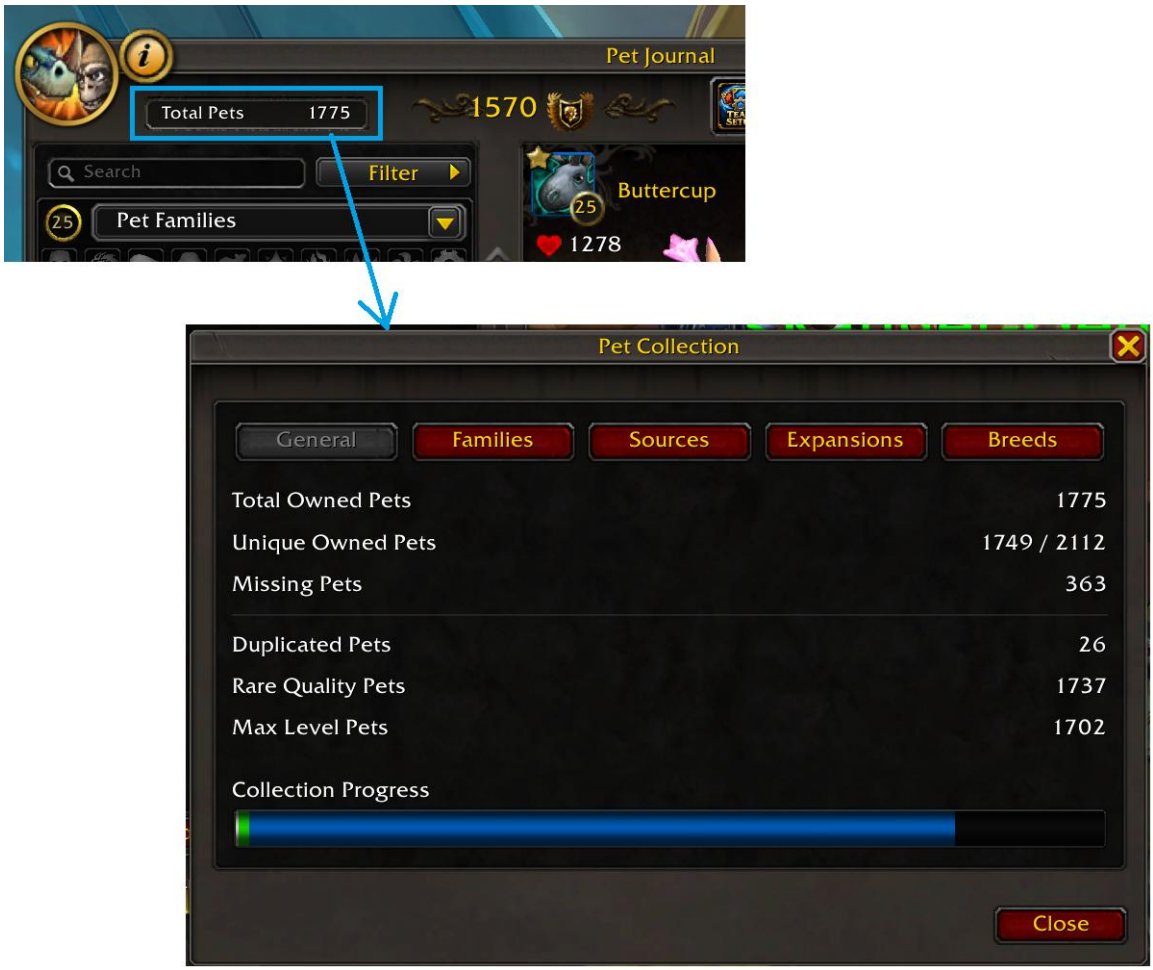

The pet collection dialog provides a collection overview with progress statistics.

Step by Step

1. Open Pet Collection by clicking on the **Total Pets** section in the Pet Journal.
2. Review the collection overview.
3. Click on the tabs to see your collection per category, like expansion, and breed.
4. You can also see how many pets you are missing and from which source or family.

Important Notes

Collection statistics may depend on current journal data and active filters, best to check it out when no filters are active. It could also be that the number of unique pets may not look correct when comparing it to your collection on like Warcraftpets, this is because pets that have an Alliance and Horde version are counted as 1 pet, not 2 in the game.

13. Pet Card: Individual Pet Information

The Pet Card includes the most important pet information needed.

Step by Step

1. The pet card shows on each pet in the pet list, but it depends on how you have set the options.
2. You can read the basic information on the card, like family, breed, stats, and abilities.
3. More information can be read when the option is chosen to pin the card on click.
    a. Information can be found with hovering over the following:
        i. Pet icon – source and description in tooltip
        ii. Pet family icon – family information tooltip
        iii. Pet abilities – ability information tooltip
        iv. Possible breeds (if enabled) – breeds availability and stats in tooltip (from Battle Pet BreedID addon)

Important Notes

Not all information is necessarily available for every pet. More can be added to the pet card in future, either on pet information, or when an another addon wants an extension set to PetMatch.

There are three options for the pet card in the Options panel.

Pet Card – choose how the pet cards opens:

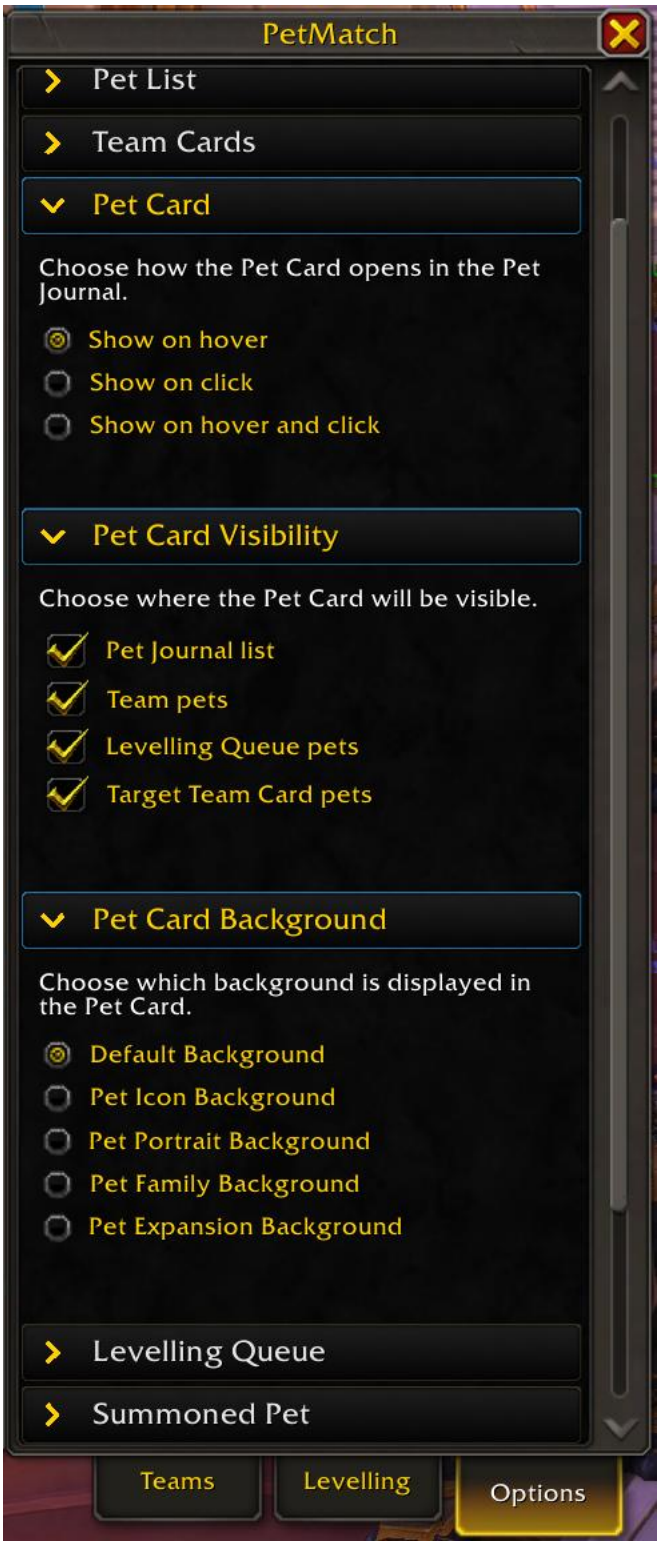

- Show on hover – only shows the pet card on hovering over the pet (the default option)
- Show on click – only shows the pet card when clicking on the pet, this also pins the card so more information can be read.
- Show on hover and click – shows the pet card on hovering over the pet, and pins the card when clicking on the pet so you can read more information about the pet.

Pet Card Visibility – choose where the pet card will be visible, these options can all be checked, or only check the ones you want to have shown on:

- Pet Journal list
- Teams pets
- Levelling Queue pets
- Target Team Card pets

Pet Card Background – choose which background is displayed on the pet card, this is about the background of the part with the pet model and the pet stats:

- Default background – this is the black marble background you see everywhere
- Pet Icon background
- Pet Portrait background
- Pet Family background
- Pet Expansion background

14. Filters, Sorting, and Search

PetMatch extends the default Blizzard filtering and search in the Pet Journal.

Step by Step

1. Click on the **Filter** menu button to open de filters and see the extended filters added.
2. You can filter for something specifically, or combine filters as well.
3. In the menu is also the **Sort By** menu, this will let you sort your pets – you can choose up to three sort options at the same time.
4. Use search not to only search on pet names and ability names, you can use search also for;
    a. level, health, power, speed – i.e. level=12, speed>240, power<300, ...
    b. expansion, rarity, type, breed – i.e. expansion=tww, type=beast, breed=s/s, ...
    c. favorite, canbattle, tradable, owned – i.e. canbattle=true, owned=false, ...
    d. Search for words or parts of sentences from the description of abilities, the description of the pet, and the source.

Important Notes

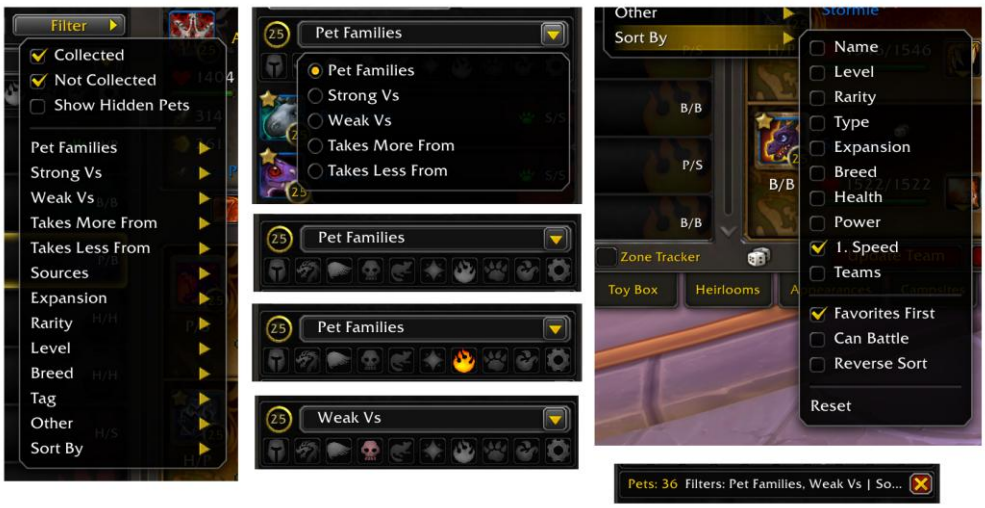

A pet missing from the list has not necessarily been deleted: check active filters first. All search, filters, and sorting options can be combined.

There is also the filter bar, with this bar you can filter pets on family, strong vs, weak vs, takes less from, and takes more from. These filters are based on the family from the pet, and the family of the abilities as well.

There is an option in the Options panel for the filter bar; **Pet Type Filters**, here you can set the following:

- Filter Bar and Filter Menu – this shows both the filter bar and the options in the Filters menu
- Filter Menu Only – this will hide the filters bar, and only show the options in the Filter menu
- Filter Bar Only – this will only show the filters bar, and not the options in the Filter menu

The status bar appears when filtering is happening, and you can clear the whole filtering, and sorting with the close button, this also shows the count of the pets that are filtered, sorted, and searched.

15. Team Statistics

Each team provides a team statistics dialog via the team menu.

Step by Step

1. Right click, or click on the button with the three dots to open the team's menu.
2. Click on the **Statistics** menu option.
3. You can check the dialog with the overall statistics.
4. You can click on the tabs if you want to see statistics for only PvE or PvP.

Important Notes

The statistics of each team only shows the win or loss ratings in PvE and PvP, and how many matches you have won, or lost, or had a draw. For now this is the only statistics added to PetMatch as I think when going too deep into this, the addon gets bloated, and there are other addons where you can check results of the battles, etc.

Maybe in the future I will add more to this, but for now this will do. I realize that not everyone is into these sort of things either, no matter what some people are saying.

16. Team Notes and Scripts

Team notes and scripts provide the ability to set notes to the saved team, or set a script to the team for auto battling.

Step by Step for Notes

1. Right click on the team to open the menu.
2. Click on **Add/Edit Notes** to open the Notes dialog.
3. Edit or write a note.
4. Click **Save** to save the note.

Step by Step for Scripts

1. Right click on the team to open the menu.
2. Click on **Add/Edit Script** to open the Notes dialog.
3. Edit or write a script.
4. Click **Save** to save the script.

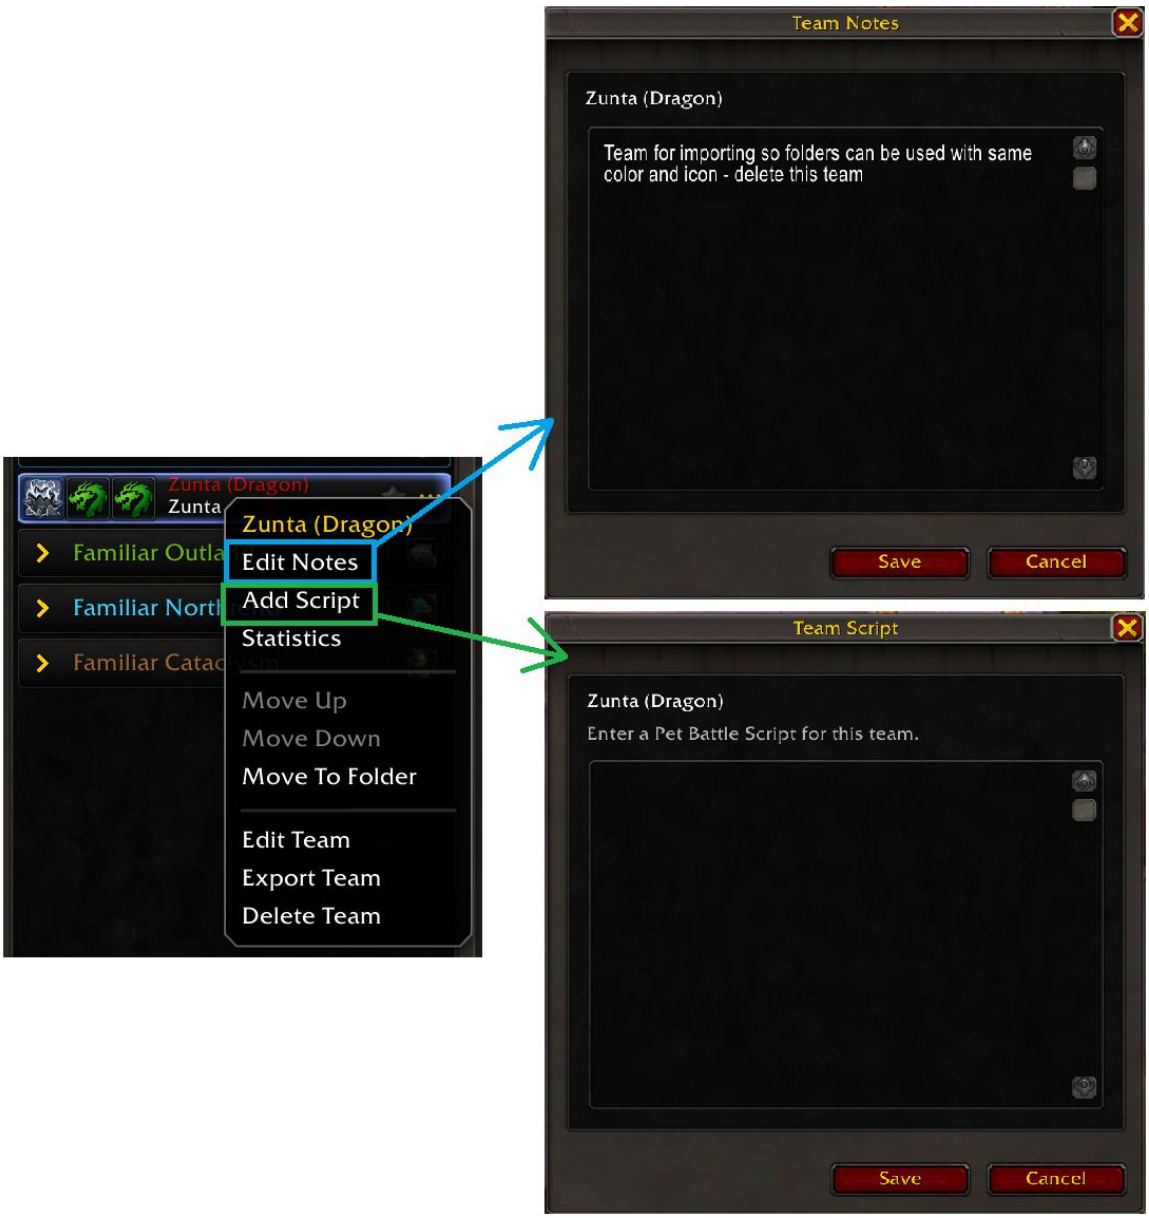

Important Notes

A script set on the team does not mean PetMatch will execute the script. Scripts get executed by the addon **Pet Battle Scripts**, this addon will look at the script that is set on the team, and activates the Autobattle button during the fight.

It is important in order to be able to use scripts, that you have the following addons installed:

- **PetMatch_PetBattleScripts** – this is PetMatch's plugin addon that connects PetMatch with Pet Battle Scripts.
- **Pet Battle Scripts** – the new version, the old version is tdBattlePetScript which will not work with PetMatch.

!! PetMatch has done it this way with the scripts, and also made integrations for other addons, just so that people keep using those addons as well, PetMatch respects the creators of those addons by not copying and pasting their code into PetMatch !!

17. Options

The Options panel let you manage the options related to PetMatch and the Pet Journal.

Step by Step

1. Open the options panel by clicking on the **Options** tab.
2. Check each option that you can change.
3. If you change an option you do not have to reload.
4. Check if the chosen option is effectively working.
5. Set each option to what you want, make the Pet Journal and PetMatch look, feel, and work the way you want.

Important Notes

These options are all set to the active profile, they do not work globally for all profiles. If you download the PetMatch.lua from the Import Tool, all the options will be set to their default values, so you have to check and change where needed. More options are probably going to follow in future.

18. Profiles

PetMatch includes a profile management interface in the AddOns panel from the Options in the game itself.

Step by Step

1. Open PetMatch settings via : **Game Menu > Options > AddOns > PetMatch**.
2. The Default profile will be used by default and cannot be renamed or deleted.
3. Use the buttons to Create/Rename/Delete a profile.
4. Use the **Copy From** dropdown to copy an existing profile into the selected profile.

Important Notes

Each character can use its own profile, and a profile can be used by multiple characters. You do not need to reload the game when switching, creating, renaming, deleting, or copying profiles.

Be aware that the options in the Options panel are set to the profile, so you can set different options on different profiles if you want.

19. UI skins

PetMatch includes separate skins for ElvUI and EllesmereUI, these are managed by a skin manager behind the scenes.

Step by Step

1. When you have your desired UI addon enabled, you can go to : **Game Menu > Options > AddOns > PetMatch**.
2. Below the profile management you will find the section for the UI Skin setting.
3. Select the UI Skin for the UI addon you are using.
4. Click on **Reload UI** to reload the game.

Important Notes

The skins are only for letting PetMatch visually match with the UI addon. Functionalities do not change. The skins are set globally to the addon, which means that no matter what profile you pick, it will not change the chosen UI skin. Reloading the game is important in order to see the skin you have selected. There is no auto select skin done in PetMatch, this is on purpose because UI addons also have to option to set the Pet Journal to the original skin from Blizzard, so PetMatch can be set how you want it to be set depending on the settings you set in the UI addon.

ElvUI skin

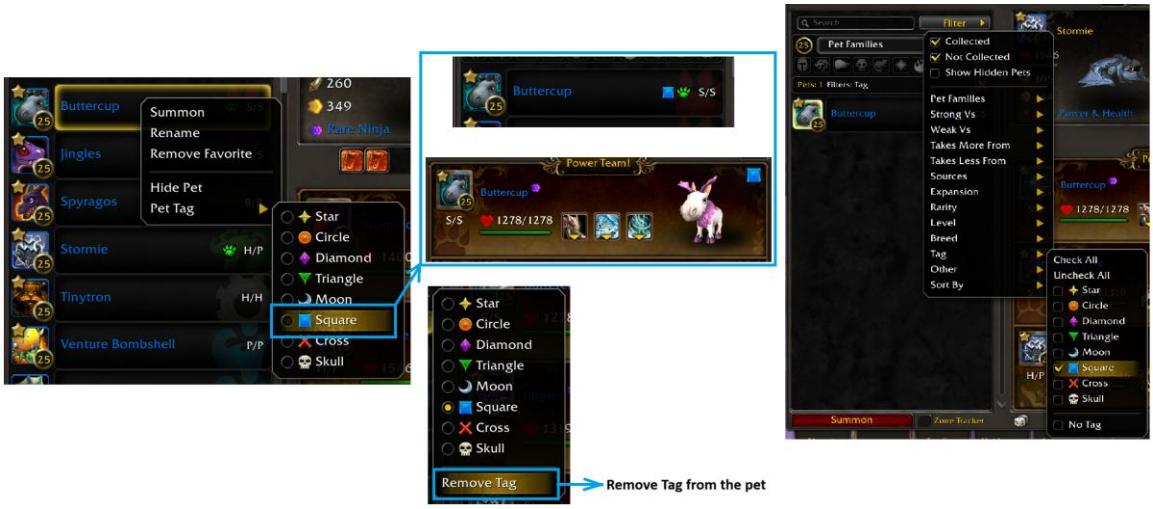

EllesmereUI skin

20. Pet Tags, Hide Pets, and Random Teams

PetMatch makes it able to give each pet a tag, this can be handy if you want to group some pets, of being able to filter easily to see certain pets.

Step by Step using tags

1. Right click on the pet in the pet list from the Pet Journal.
2. Go to the **Pet Tag** menu option.
3. Select the tag you want to set on the pet.
4. After selecting you will see the tag next to the breed (or on the right side when not having breeds enabled).
5. The tag is also visible when the pet is loaded into a pet slot, you will see the icon in the top right corner, or next to the icon that is set for the pet slot as a special slot (levelling or family icon for example).
6. Open **Filters** menu and go to the **Tag** option, there you can check the tag you want to filter the pets on.
7. Right click the pet, and go to the **Pet Tag** menu option, click on **Remove Tag** to remove the selected tag from the pet.

PetMatch also lets you hide pets, is there a certain pet you do not want to see anymore, or find anymore, is it an unobtainable you do not own it? You can hide this pet if you really want to. Hiding pets do not remove them from your collection, they will just be hidden from the pet list, but saved into the hidden pet list. You can also show all your hidden pets with the filter option in the Filters menu.

Step by Step using Hide Pet

1. Right click on the pet in the pet list from the Pet Journal.
2. Click on the **Hide Pet** menu option.
3. There won't be a confirmation dialog, the pet will be hidden immediately.
4. Open **Filters** menu to filter on the hidden pets, you can uncheck Collected and Not Collected, and check **Show Hidden Pets** to only show the hidden pets, this way you can unhide them as well (you can combine this with Collected and Not Collected as well).
5. To unhide the pet, make sure the hidden pet is visible in the pet list, then right click on the hidden pet, and click on **Unhide Pet**.

PetMatch has implemented a Random Battle Pets button, this button is for when you want to have random pets in your pet slots, or you want a challenge, click the button, and start a battle. The button does not only randomize your owned level 25 battle pets, but it also randomizes the selected abilities on each pet. This is just a little fun thing you can use if you want.

21. Optional Addons and Integrations

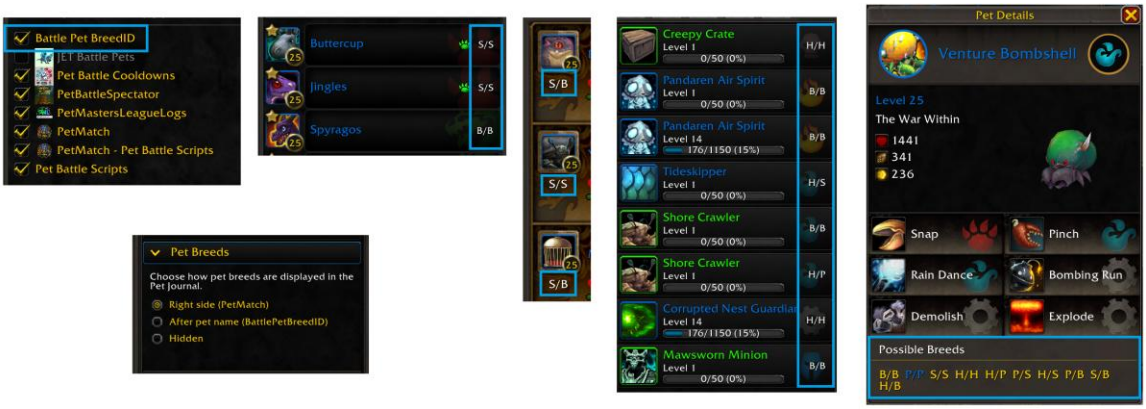

PetMatch has no required Battle Pet addon dependencies. Additional integrations are optional and should be installed only for the capabilities you want.

Battle Pet BreedID — Adds breed information, including possible breeds and detailed breed data in the Pet Card; placement and visibility can be configured in the Options panel.

Pet Battle Scripts — Provides Battle Pet scripting functionality, let you be able to use the Autobattle button during a fight.

PetMatch_PetBattleScripts — Connects Pet Battle Scripts with PetMatch teams; both addons are needed for that integration.

PetMastersLeagueLogs — When installed, PetMatch detects it and adds quick access from the Teams panel – see the button next to the New Folder button. This is just to easily open up the addon and check on the battle logs or pet usage.

Battle Pet BreedID

With scripts enabled

With PetMastersLeagueLogs enabled

22. Pet Journal QoL Features and About PetMatch

PetMatch extends the existing Blizzard Pet Journal rather than replacing it. Depending on enabled settings, enhancements include compact layouts, additional pet information, queue and tag indicators, overlays on Battle Pet slots, active team names above the slots, Load and Unload controls, contextual actions, breed placement, and enhanced search, filtering, and sorting.

The first goal of PetMatch is to make your life on Azeroth a lot easier when you are doing pet battles, or you are collecting pets, or you just are roaming your collection to see what you still need to collect, to have teams saved that you use for certain targets, or to certain things you want to use a specific team for (like a pet catching team), so you can easily switch teams when and where needed, to top this, PetMatch also provides the autoload team feature, for the ones who are lazy, and just want to click the target and have the team automatically loaded.

The second goal of PetMatch is to have the addon feel as if it is part of the game itself, like you have not installed an addon for all the things you see and can do in the Pet Journal. It is visually made as if it truly is part of the Pet Journal. This is why PetMatch is not a standalone addon, and it will never become one either.

PetMatch is not a copy from Rematch, it is not the same as Rematch, the addon is written from scratch by my own two hands because I wanted to give something to the WoW pet community so people can keep happily managing their pets and teams.

PetMatch is meant to replace Rematch, so it made sure its functionalities do feel as if they are the same as in Rematch. PetMatch uses the import string from Rematch for the easiness of importing and exporting, and because a lot of other sources are using Rematch strings. There are differences between the two addons, like for example Rematch has the possibility to be used as a stand alone addon, PetMatch has not, and PetMatch has a Team Setup mode that Rematch does not have.

I truly hope that everyone enjoys using the addon, and enjoys doing pet battles!

I have other addons for pet battling, and battle pets.

- **PetMastersLeagueLogs** – this addon is especially made for the PML tournaments, but can be used by anyone who wants to log their PvP pet battles, the addon works only for PvP battles, and also saves the pet usage of both players including some pet information.
- **PetBattleCooldowns** – this addon adds the abilities of the pets, to the pets in the pet battle UI, it will show the cooldowns on the abilities used, it will also change the color of the health bar when the pet lowers in health, it will show the stats beneath the health bar of the active pet, it shows buffs and debuffs that you can hover over to see the information, and it adds keybinds to the Forfeit and Pass buttons on the action bar.
- **PetBattleSpectator** – this addon adds the combat logs from the battle on both sides of the screen, so you can read what is going on, for PvP battles it also has a round timer that can be shown, the addon is simple, and has some settings to it.

23. Troubleshooting and Bug Reporting

Addon Not Visible

Check the folder structure, addon enabled status in the AddOns list, and the correct game client.

A Team Seems to Have Disappeared

Check the selected folder, active filters, and profile context before restoring anything.

Pets Missing from a List

Reset search criteria and filters, then check the pet list again. Filters and search will only show the results, not the whole pet list, keep this in mind.

Import Produces Unexpected Results

Review the preview and test with a small export sample. If your import is too large, and you used the Import Tool, it is better to download the PetMatch.lua file instead and replace this with the existing one in the SavedVariables folder of the game. If you truly want to import the team by hand, then it is better to do it on chunks, and not the whole string at once, it gives you more control on what is happening and what you are importing.

Layout Looks Different

Check if you are using an UI addon like ElvUI, that you have set the UI skin right in the settings from PetMatch.

Queue Contains the Wrong Pets

Check queue order, queue options, and recent imports. PetMatch uses a different import string than Rematch, if you had pets in the queue in Rematch, I recommend to use the Import Tool, and then copy the import string for PetMatch there, so you can import the pets in the queue from PetMatch. Right now, the queue only has the import, and export, the add all levelling pets, and clear queue options available.

Options Appear to be Changed to their Defaults

Check the selected profile and SavedVariables files; never overwrite files without a backup. Keep in mind when using the PetMatch.lua from the Import Tool, or you make a new profile, the options will all be set to their default values.

What to do when you find a bug or get an error

If you have found any bug related to PetMatch, or you are receiving lua errors related to PetMatch, please do not hesitate to contact me. This you can do on Discord, I am in the servers from Warcraftpets, Xu-Fu's pet guides, and the PML. You can also contact me on CurseForge by sending me a message or write a comment, though I might not always see this directly.
Since I have done most things now in PetMatch, I have decided to open up the GitHub repository for PetMatch to the public. This, however, doesn't mean you can just go and do whatever you want with the code, the full copyrights is still on the addon and on my code, but this gives you, and even me an easier way to communicate about issues, bugs, and requests.
Please be respectful of the copyrights and licenses!
You can find the repository here : https://github.com/MartineBoulanger/PetMatch/issues
